<b>Notes</b>	

Risk of bias table

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	SUPPORTING ANNOTATIONS: "The block randomization schedule was created using JMP statistical software (SAS, Cary, NC)."
Allocation concealment (selection bias)	Unclear risk	COMMENTS: No information on method described for concealing allocation.
Blinding of participants and personnel (performance bias)	High risk	SUPPORTING ANNOTATIONS: "The patient and surgeon were aware of the randomization at the time of surgery."
Blinding of outcome assessment (detection bias)	Low risk	COMMENTS: Not mentioned, however the outcome hip dislocation is probably not at risk of bias due to non-blinding. Some outcomes are self-reported. Considered low because dislocations is the critical outcome
Incomplete outcome data (attrition bias)	Low risk	COMMENTS: Low attrition in both groups (intervention 14/159, control 15/154)
Selective reporting (reporting bias)	Low risk	COMMENTS: Outcome reporting matches pre-registration: NCT03341442
Other bias	Unclear risk	SUPPORTING ANNOTATIONS: "participants in the NHP group reported adhering to some form of hip precautions in 28% of the cases." COMMENTS: Risk of contamination because hip precautions are being followed to some degree in the "no hip precaution" group

Lightfoot 2020

<b>Methods</b>	<b>Study design:</b> Prospective cohort study
<b>Participants</b>	<p><b>Baseline Characteristics</b></p> <p>Intervention</p> <ul style="list-style-type: none"> <li>● <b>Age, mean (SD):</b> 67 (11.2)</li> <li>● <b>Female, N (%):</b> 73 (62)</li> <li>● <b>BMI, mean (SD):</b> 29.1 (5.34)</li> <li>● <b>Posterior surgical approach, N (%):</b> 82 (69)</li> <li>● <b>Femoral head size ≤ 28 mm, N (%):</b> Data not presented</li> </ul> <p>Control</p> <ul style="list-style-type: none"> <li>● <b>Age, mean (SD):</b> 68.2 (10.1)</li> <li>● <b>Female, N (%):</b> 85 (71)</li> <li>● <b>BMI, mean (SD):</b> 29.1 (8.85)</li> <li>● <b>Posterior surgical approach, N (%):</b> 82 (69)</li> <li>● <b>Femoral head size ≤ 28 mm, N (%):</b> Data not presented</li> </ul> <p><b>Included criteria:</b> &gt; 18 years and scheduled for an elective primary THR</p> <p><b>Excluded criteria:</b> Not speaking or reading english, previous history of revision surgery on either hip, admitted for "complex" surgery (as defined by the surgeon, but typically involved bone grafting) or revision surgery, had dementia documented in medical notes.</p> <p><b>Pretreatment:</b> Comparable, 62% female in hip precaution group vs. 71% female in no hip precautions group.</p>
<b>Interventions</b>	<p><b>Intervention Characteristics</b></p> <p>Intervention</p> <ul style="list-style-type: none"> <li>● <b>Description:</b> In phase 1, patients were taught hip precautions which involved education about specific hip joint movements to avoid (flexion beyond 90 degrees, adduction and rotation) and practising activities of daily living (ADLs) within these movement restrictions, such as getting on and off chairs. a standard package of equipment was provided which included a raised toilet seat.</li> <li>● <b>Duration:</b> No information (maybe 6 weeks)</li> </ul> <p>Control</p> <ul style="list-style-type: none"> <li>● <b>Description:</b> In phase 2, hip precautions were not taught. The new regime was an individualised approach to rehabilitation that</li> </ul>

	<p>encouraged patients to move as they were able, within a comfortable range of motion and as pain allowed. Specialist equipment was only provided to those patients who required it, following clinical assessment.</p> <ul style="list-style-type: none"> <li>● <b>Duration:</b> No information</li> </ul>

<b>Notes</b>	

Risk of bias table

Bias	Authors' judgement	Support for judgement
Random sequence generation (selection bias)	Low risk	SUPPORTING ANNOTATIONS: "randomization was performed immediately post-operatively to avoid patient-selection bias or alteration in surgical technique. Sealed envelopes were made by the study coordinator and contained group designation as determined by a random numbers table. These were opened after surgery and before transfer to the floor to reveal a patient's group assignment."
Allocation concealment (selection bias)	Low risk	SUPPORTING ANNOTATIONS: "Sealed envelopes were made by the study coordinator and contained group designation as determined by a random numbers table. These were opened after surgery and before transfer to the floor to reveal a patient's group assignment."
Blinding of participants and personnel (performance bias)	High risk	SUPPORTING ANNOTATIONS: "Study participation and group assignment were noted on the home screen of the patient's electronic medical record, with nursing and physical therapists specifically reminded of study protocol. To help mitigate this risk, surgeons remained blinded to randomization group until completion of the surgery, and extensive measures were taken to inform all postoperative care providers as to the study protocol." COMMENTS: not feasible to blind patients or personnel Der er blindet så langt som man kan ift interventionens art
Blinding of outcome assessment (detection bias)	Low risk	COMMENTS: The critical outcome (dislocations) is probably not at risk of bias Some important outcomes are self-reported
Incomplete outcome data (attrition bias)	Low risk	COMMENTS: Low attrition in both groups (intervention 4/292; control 5/295). Fig 1
Selective reporting (reporting bias)	Low risk	COMMENTS: Outcomes reported matches those stated in protocol (NCT02686528)
Other bias	Unclear risk	SUPPORTING ANNOTATIONS: "For 74 of 291 (25.4%) hips in the restricted group, patients admitted failure to observe some or all the prescribed hip pre-cautions at the 6-week postoperative visit. Meanwhile, for 65 of 294 (22.1%) hips in the unrestricted group, patients stated that they observed at least some hip precautions despite not being required to do so."
