Characteristics of studies

Characteristics of included studies

Boltz 2014

Methods	Study design: Controlled trial. This study used a comparative repeated-measures design in three medical units of a community teaching hospital in the northeast United States. The units were matched based on size, staffing, and physical configuration. One unit served as the intervention unit, and two units served as control units.				
Participants	<p>Baseline Characteristics</p> <table> <tr> <td>Intervention</td> <td> <ul style="list-style-type: none"> • Sex (<i>female</i>): 44% • Age (<i>mean, SD</i>): 82.2+6.7 • Barthel admission (<i>mean, SD</i>): 81.6+21.7 </td> </tr> <tr> <td>Control</td> <td> <ul style="list-style-type: none"> • Sex (<i>female</i>): 62% • Age (<i>mean, SD</i>): 79.5+8.1 • Barthel admission (<i>mean, SD</i>): 82.2+25.7 </td> </tr> </table> <p>Included criteria: Patient eligibility included aged 65 and older and English-speaking and reading. Patients who were known to be terminally ill or receiving hospice care or surgery were excluded. Family members aged 21 and older whose relatives met inclusion criteria were eligible if they could speak and read English; were related to the patient by blood, marriage, adoption, or affinity as a significant other; and were primary FCGs who lived with the patient or provided caregiving from an alternate residence.</p> <p>Excluded criteria: Patients who were known to be terminally ill or receiving hospice care or surgery were excluded. Samt de der ikke gav tilladelse</p> <p>Pretreatment: se table 2 - men eneste der kan betyde lidt er kønsforskellen - hvis vi mener at hustruer er bedre til at intervenere end mænd. Og det kan da ikke udelukkes ;)-og interventiongruppen er ældst (=styrker resultaternes forskel)</p>	Intervention	<ul style="list-style-type: none"> • Sex (<i>female</i>): 44% • Age (<i>mean, SD</i>): 82.2+6.7 • Barthel admission (<i>mean, SD</i>): 81.6+21.7 	Control	<ul style="list-style-type: none"> • Sex (<i>female</i>): 62% • Age (<i>mean, SD</i>): 79.5+8.1 • Barthel admission (<i>mean, SD</i>): 82.2+25.7
Intervention	<ul style="list-style-type: none"> • Sex (<i>female</i>): 44% • Age (<i>mean, SD</i>): 82.2+6.7 • Barthel admission (<i>mean, SD</i>): 81.6+21.7 				
Control	<ul style="list-style-type: none"> • Sex (<i>female</i>): 62% • Age (<i>mean, SD</i>): 79.5+8.1 • Barthel admission (<i>mean, SD</i>): 82.2+25.7 				

<p>Interventions</p> <p>Intervention Characteristics</p> <p>Assessment and modification as needed of lighting, pathway clearance, seating, bed height, toilet height, access to and storage of sensory and mobility aidsShift report that includes patient and familyBedside write boards to facilitate communication and storage of care plansInformation on admitting condition, diagnostics, and treatmentFamily and patient education addressing:o Rationale for interdisciplinary interventions to prevent delirium and functional decline (e.g., avoiding high-risk medications and encouraging mobility):o Techniques the FCG could employ (e.g., encouraging and motivating self-care and physical activity, supporting cognitive and social engagement to support return to normal roles and routines, help with meals):o Discharge checklist (e.g., follow-up care for acute admitting problem as well as function-focused care—physical activity and routine, social engagement, cognitive stimulation)Systematic inclusion of FCG and patient in:o Assessment (including baseline cognition and physicalfunction):o Jointly developed bedside goals and care plans that supportfunctional recovery and prevention of complications(communication, mobility and physical activity, self-care,cognitive stimulation, nutrition, sleep, appropriate medicationuse, comfort measures, anxiety relief), updated daily withassigned nursing staff, FCG, and patientCollaboration emphasized with other disciplines, including rehabilitation:o Plans that delineate FCG involvement in care:o Discharge teaching and planning incorporating functionfocusedcare dimensions in addition to management of medicalconditionPostacute follow-up by FCRN to provide ongoing education andmodification of the function-focused care plan through:o Home visit within 48 hours of discharge:o Weekly telephone calls for 4 weeks:o Coaching the patient and FCG to collaborate with postacute providers</p>	<p>Outcomes</p> <p><i>Død (Mortality) FU</i></p> <ul style="list-style-type: none"> ● Reporting: Not reported (1 death reported during hospitalization, but unclear in which group) <p><i>Indlæggelsestid (Length of stay) EoT</i></p> <ul style="list-style-type: none"> ● Outcome type: ContinuousOutcome ● Direction: Lower is better ● Data value: Endpoint <p><i>Genvindelægelse (Readmission to hospital) 30 days FU (we wanted min 3 months)</i></p> <ul style="list-style-type: none"> ● Outcome type: DichotomousOutcome ● Direction: Lower is better ● Data value: Endpoint <p><i>Delirvarighed (Duration of delirium) EoT</i></p> <ul style="list-style-type: none"> ● Reporting: Not reported <p><i>Fald (Falls) EoT</i></p> <ul style="list-style-type: none"> ● Reporting: Not reported

Notes	<p>Helle Svenningsen on 28/05/2016 18:42</p> <p>Outcomes ang delirium. De tæller ikke dage men alvorlighed: "The severity of delirium was evaluated using the Delirium Rating Scale, a 10-item scale that ranges from 0 (no delirium) to 32 (highest degree of severity)." ang funktionsniveau: jeg har indtastet 2 mdr data</p>

Risk of bias table

Bias	Authors' judgement	Support for judgement
Sequence Generation	High risk	Not randomised
Allocation concealment	High risk	Not randomised
Blinding of outcome assessors	High risk	
Blinding of participants and personnel (performance bias)	High risk	
Incomplete outcome data	Low risk	
Selective outcome reporting	Low risk	
Other sources of bias	High risk	Caregivers are different between the two groups. Co-interventions are not accounted for. There might be a difference in the rehabilitation offered in the two group.
